Through this book, Regis and Savoy Capital explores twenty long-term themes that could shape the next era of economies, industries, and capital. The objective is not to predict the future, but to recognize structural change early and position thoughtfully ahead of it.

03

Energy Transition & Storage

The Backbone of the Energy Transition

The global energy transition is entering its next phase. While renewable generation capacity has expanded rapidly, the ability to store and distribute energy efficiently has become the critical constraint.

Intermittent power sources such as solar and wind require large-scale storage solutions to ensure grid stability. As renewable penetration increases, energy storage is becoming a strategic necessity rather than a technological option.

India's renewable targets and rising electricity demand are accelerating investments in battery manufacturing, grid-scale storage, and integrated energy management systems.

India's financialisation cycle is driving growth in trading volumes, investor participation, and product innovation. Exchanges, depositories, and transaction platforms benefit directly from this structural expansion.
